

make you miss a rider update. Leaving everything on may mean ten discount alerts a day. The power move is not total silence. It is selective permission.

On many Android phones, you can long-press a notification and jump directly to that app's notification settings. This is one of the fastest ways to discipline a noisy app. Do it the moment an irritating notification appears. Do not postpone. Every ignored annoyance becomes normal.

Step-by-step: silence promotions without killing useful alerts

Wait for a noisy notification to arrive. Then go through the following steps...

- Long-press the notification.
- Tap Settings, Turn off notifications, or the gear icon, depending on your phone.
- Look for notification categories such as Promotions, Offers, Recommendations, Marketing, Order updates, Messages or Payments.
- Turn off the promotional categories.
- Keep transactional categories on.
- Go to Settings > Notifications > App notifications later and review the same app again.
- Repeat this for shopping, food, gaming, video, travel and ticketing apps.

This one habit changes Android dramatically. Instead of cleaning notifications once a week, you train the phone in the moment. Annoying app? Correct it immediately.

Notification history: your panic undo button

Everyone has done it. You swipe away a

notification and immediately realise it was important. Notification history exists for this exact reason. Android's open-source documentation describes notification history as a screen where users can see snoozed notifications, recently dismissed notifications and a history of notifications from the last day, though implementation may vary by device maker.

Turn it on before you need it. Notification history usually starts recording only after it is enabled.

Step-by-step: turn on notification history

- Open Settings.
- Search for Notification history.
- Tap the result.
- Turn on Use notification history.
- Dismiss a test notification.
- Return to Notification history and confirm it appears.
- Add a shortcut mentally: whenever something vanishes too quickly, search Notification history.

This is especially useful for users who receive many transactional alerts. It is also useful for parents and professionals who clear notifications in a hurry and later need to check what they missed.

Lock-screen notifications need discipline

Your lock screen can betray you. A locked phone showing full message previews is not fully private.

Search for Lock screen notifications in Settings. Choose whether to show notification content, hide sensitive content, or show no notifications on the lock screen. For most people, hiding sensitive content is the best compromise. You still know an alert arrived, but details remain hidden until unlock.

Also think about where your phone rests. Many people keep phones face-up during meetings. If your lock screen lights up for every message, your attention leaks and so does your privacy. Turn off wake-screen behaviour for noisy apps where possible.

Do Not Disturb is not airplane mode

Do Not Disturb, or DND, is often misunderstood. It is not the same as switching off the phone. Google's Android support explains that Do Not Disturb and custom modes such as Bedtime or Driving can be
