

## WEARABLE DATA CAN BE WRONG

**Y**es, wearables have been known to mess up every now and then – we’ve seen it while testing wearable devices at Digit Test Labs, as well. Wearable devices should be viewed as supplementary tools to enhance your mindfulness practice and overall well-being rather than a replacement for medical expertise. The insights gathered from these devices can support your self-care efforts when used responsibly. However, if you experience any health concerns or if your data shows unusual trends, please seek professional advice immediately. Your well-being is paramount,

and proper medical guidance is crucial to ensure any new technology enhances rather than compromises your health.

If you’re suffering from a medical condition, then before relying on any wearable device as a primary tool for managing your health, it is essential that you consult with a qualified healthcare professional. Your physician or a licensed healthcare provider can offer personalized recommendations and help integrate technology with your overall treatment plan, ensuring it aligns safely with any existing conditions or medications.

monitor key metrics that empower you to react mindfully in the flow of daily life.

## 1. Apple Watch (Series 8/9/10 and Ultra)

How it aids mindfulness:

- **Heart Rate & HRV Monitoring:** The Apple Watch provides continuous heart rate monitoring and HRV analytics, offering clear signals when your body is under stress.
- **Mindfulness App Integration:** It features the native Breathe app for guided breathing exercises and also integrates with third-party mindfulness apps.
- **Reminders to Breathe:** With haptic feedback and customizable mindfulness reminders, the device nudges you to pause, breathe deeply, and reconnect throughout the day.

One example of how it works:

1. Open the Breathe app.
2. Set a 5-minute breathing session with intervals.
3. As you begin, the watch’s gentle tap will remind you to focus on your breath.
4. Check your HRV before and after the session to assess improvement.

## 2. Fitbit Sense

Mindfulness enhancement by:

- **Stress Management Score:** Fitbit Sense tracks electrodermal activity (EDA) to provide insights into your body’s stress response.
- **Guided Breathing Sessions:** The device recommends on-the-spot breathing exercises based on your stress level.
- **Sleep and Recovery Analysis:** In-depth sleep tracking helps you see how daily mindfulness practices improve nighttime recovery.

You can use it like:

1. Wear your Fitbit Sense daily to continuously monitor your stress.
2. When your stress score spikes, the device will prompt you with a “Breathe” reminder.
3. Select the guided breathing session from the notification.
4. Follow the visual and audio cues while monitoring changes in your stress levels.

## 3. Garmin Venu 2

It can help with:

- **Advanced Health Monitoring:** Garmin Venu 2 records heart rate, stress, pulse oximetry, and respiration rate.
- **Body Battery Energy Monitoring:** This unique feature calculates your energy reserves, guiding you on when to rest or meditate.
- **Mindfulness Apps Integration:** Compatible with popular third-party mindfulness apps that extend its functionality.
