

Network security on the go

Mastering secure connectivity and network defence
everywhere

This chapter examines how to safeguard your mobile data when you're on the move – whether you're joining public Wi-Fi in a café, tethering via a hotspot, or pairing over Bluetooth and NFC. We'll start by outlining the hidden dangers of open networks and walk through a thorough, illustrated process for safely connecting – down to disabling auto-join and turning off file sharing – plus real-world examples of “evil twin” attacks at airports.

Next, you'll learn how to configure reliable mobile VPNs on both Android and iOS step by step – covering protocol selec-

tion, profile import, and automatic reconnection – ensuring encryption wherever you roam. We then tackle short-range wireless threats: from “BlueBorne” Bluetooth exploits to NFC relay attacks – and show you exactly which settings to toggle and firmware updates to apply. Finally, we delve into per-app firewalls, DNS-level filtering (with CleanBrowsing or DNSFilter), and traffic-monitoring tools to detect and block malicious connections in real time. By chapter's end, you'll possess a layered, portable network-security posture that travels with you.
