

Build a podcast setup at any budget

Build smart, sound better, and upgrade only when needed

Podcast equipment is an unusually effective way to procrastinate. It is easy to spend weeks comparing microphones, interfaces, headphones and acoustic panels without recording a single useful sentence. The reassuring truth is that you can begin with the phone already in your pocket. Better equipment matters, but only after you understand what problem you are trying to solve.

Your first setup should therefore be built around three questions: how many people will record together, where they will record, and whether video is part of the plan. A solo podcast from a quiet bedroom needs very different equipment from

a four-person round-table or an interview series recorded in cafés and offices.

Start with the room, not the mic

A ₹30,000 microphone in a noisy, echo-filled room can sound worse than a modest microphone used intelligently. Before buying anything, stand in your proposed recording space and clap once. If you hear a metallic or fluttering echo, the room needs attention.

Soft furnishings help. Curtains, rugs, mattresses, sofas, cushions, filled bookshelves and even a thick blanket hung behind the microphone can reduce reflections. They will not soundproof
