

Record clean audio anywhere

Capture clear voices home, outdoors or remotely

Buying a decent microphone is only half the job. Clean podcast sound depends on controlling three things before you press Record: the space, the distance between mouth and microphone, and the recording level. Get those right and editing becomes easier. Get them wrong and software will be repairing damage rather than polishing a good recording.

For Indian home podcasters, the challenge is often less “studio acoustics” and more everyday life: ceiling fans, air-conditioners, traffic horns, construction, pressure-cooker whistles, neighbours, barking dogs and unreliable power. You do not need

silence. You need a repeatable method for reducing what the microphone hears besides the speaker.

Prepare the room

Start by listening, not recording. Stand quietly in the room for 30 seconds. Notice continuous noises such as fans, refrigerator compressors, computer fans and road traffic. Then clap once. A long, sharp echo means hard surfaces are reflecting sound back towards the microphone.

For a beginner, concentrate on reducing reflections inside the room. Curtains, rugs, sofas, cushions, mattresses and filled book-
