

Edit, mix and master your podcast

Turn raw recordings into polished, listener-ready episodes

Recording captures the conversation, but it isn't an episode until you edit and put it all together.

That does not mean removing every pause, breath or imperfect sentence. A podcast should still sound like people talking. The editor's job is to make the listener forget that editing happened at all: ideas arrive in the right order, distracting noises disappear, voices remain comfortable to hear. There's no overbearing music that clashes with dialogue, and the finished episode is consistent from beginning to end.

The easiest way to achieve that is to separate editing into stages. Do not start adjusting equalisation while you

are still deciding whether a five-minute section belongs in the episode. First fix the story, then the sound, then the overall mix.

Choose an editor you can grow with

You do not need expensive software to begin. Audacity provides the core tools needed for spoken-word work, including EQ, filters, noise reduction, gates and loudness normalisation. Adobe Audition adds a more elaborate multitrack environment, restoration tools, loudness matching and podcast-oriented processing. If you are producing a video podcast, DaVinci Resolve's Fairlight
