

Secure segmentation, guest access & remote work

Networks that serve everyone, exploit no-one

Poorly segmented networks are the single biggest reason Indian startups and small offices lose data, suffer laggy video calls, or get locked out by ransomware.

Chapter 2 tackles that head-on: you'll build airtight VLAN walls between departments, give guests fast but sandboxed Wi-Fi, throttle Facebook so payroll never stutters, and bridge home workers to HQ with standards-based IPSec or OpenVPN – all wrapped in policy templates that slash audit pain. Follow the hands-on labs and you can flip every switch with gear you already own.

1) VLAN fundamentals & jump-box isolation

Why segmentation beats the biggest firewall

A firewall on the edge is useless if marketing laptops can still ping your accounts server. Cisco's own SMB guide calls poor VLAN planning "the #1 root cause of lateral-movement breaches." Zero-Trust design says assume breach, limit blast radius; VLANs do exactly that, acting like lanes on a highway instead of one giant parking lot.
