

TP-Link VIGI Surveillance Playbook

Smarter cameras, safer spaces everywhere

No modern office network is truly “secure” until the camera feeds, power lines, and video archives are as bullet-proof as the packets running through your switches. TP-Link’s VIGI range turns big-budget CCTV capabilities into an SME-friendly kit bag: hybrid wired + wireless cameras that join the same VLAN fabric you built in Chapters 1-3, solar panels that keep a remote warehouse or farm lane under watch without a single power socket, and a cloud-native VMS that lets one person in Bengaluru monitor half-a-dozen branch offices from a browser tab. In the pages ahead, we’ll walk through a step-by-step deployment that marries EAP-series access points to VIGI cameras over PoE, show you how to size a solar array for 24-hour recording even during monsoon downtimes, and tour

the VIGI dashboard’s AI-powered intrusion and people-count analytics—proving that enterprise-grade surveillance no longer requires enterprise-grade budgets or in-house NVR rooms.

A. Seamless Wired/Wireless AP Deployment with VIGI Cameras

Deploying a seamless wired and wireless TP-Link Access Point (AP) setup with TP-Link VIGI cameras ensures efficient surveillance coverage and strong network performance.

In this setup, TP-Link APs like the EAP series (e.g., EAP245 or EAP610) are installed at indoor or outdoor locations strategically to provide maximum coverage and connected to a central router via a PoE (Power over Ethernet) switch.
