

No blind spots anywhere

TP-Link India COO **Bijoy Alaylo** on Unified Networking & Surveillance for SMBs

Indian startups and small offices are no longer satisfied with “good-enough” Wi-Fi and a handful of CCTV cameras. They want cloud-managed dashboards, AI-driven alerts, and a security posture that keeps pace with tightening data-localisation rules. Few people have a better vantage point on that shift than Bijoy Alaylo, Chief Operating Officer at TP-Link India.

In this exclusive conversation, Alaylo explains how Omada SDN and VIGI surveillance fit together, why heat-mapping beats guesswork, and what partners must do to stay relevant as AI and compliance reshape the market.

Q From your perspective, how are new-age Indian startups and small offices redefining their networking and security priorities compared with five years ago?

A Few of the emerging priorities in current world scenario has been towards Data localization and Compliance like DPDP Act towards making the IT infrastructure environment safer.

With the addition of Automation and AI integration in both the Networking as well as Surveillance industries, it has become a much bigger offering & much better to control the security part for the Clients.

Where previously it was more difficult to trouble shoot an issue now it is easier for the AI tools along with ML to detect and get actionable intel to resolve issues without need of a human intervention. On similar lines, the Surveillance products of the yesteryears were all about detect, identify and then Act but now it's a reaction in real-time as the event occurs and the AI feature triggers the intended response.

Q If a bootstrapped 15-person company asked for one must-do step to make its office network and surveillance, both reliable and secure—regardless of vendor—what would you recommend first?

A Of course, firstly it is to ensure what is the requirement of Security layering in the network needed depending on the nature
