

of work of the company. I would always suggest the customers to go for heat-map of the premise for both the Cameras and Networking setups so that we get rid of blind spots or Dead zones. Usually this is where the major lapses are found when any incident occurs. We do provide the heat map services to our registered SI's for their projects, where they get an idea not only of our products but also about their projected requirement of other non-related TP-Link products too

Q How would TP-Link build up a solution for an office which has multiple branches and would want a centralized surveillance?

A With already closures of multiple such cases, TP-Link is known for simplifying most complex solutions as well. With our advanced VMS and unified platform, TP-Link creates a mesh of both solutions to get a centralized management, proving cost-effective to the clients as well. This greater visibility over networking and surveillance security gives us an edge over many competitors who provide just one solution vis-à-vis ours wherein the entire surveillance and networking comes under one roof for easy management and deployment. This also helps in bring the TCO down for organisations.

Q Beyond hardware, what is TP-Link doing—through channel partners, training, or service programmes—to ensure small businesses outside India's major metros get the same product experience as those in big cities?

A TP-Link in the past couple of years has been concentrating on the T3 and T4 cities doing almost 30 roadshows across the Indian geography in a month. With the built-in ideology of getting more by working at the bottom of the pyramid TP-Link has launched common programs for nationwide partners like:

- Tailor made Partner Programs, Project-V and SolutionX – For SI partners in the Surveillance and Enterprise Networking industry respectively, who can login to the specific portals and get advance benefits like co-funded customer events, listing on websites, special reward rebates, dedicated technical support to name a few.
- Training and Certification program for small installers and SI so as to enable them to get projects from the leading customers. One of the key elements that we have been doing is enablement of the last mile tech foot soldiers through trainings and helping them come up in value chain. Certification is another area that we over the years have worked extensively to create a skilled blue collar work force that helps consumers with the right choice of products and solutions in one go.
- Demo Sessions – Live hands-on training to the installation engineers to get them well-versed with the newest technology launches. We have been building up on capabilities on demo zones and off late our recently inaugurated office and service locations like Pune, Lucknow, Chandigarh to name a few, all have demarcated demo zones wherein customers and

partners alike can get live hands-on experience of our latest solutions and products.

Q How is TP-Link shaping up its team structure in India to meet the rising demand in the surveillance industry?

A We have already created the first level of dedicated team of Sales and Pre-Sales in India with a set of Sales and pre-sales in each of the important cities of India handling the related states as well.

As the business growth demands there will be vertical specific teams which will handle the Business units of Government, BFSI, Retail, Hospitality.

Also, there are certain Business Analyst teams regularly working on finding what is the requirement of the partner base and what best business calls can help get maximum growth to the company.

Q How do you see the surveillance and security market shaping up in India and what is the message you would like to give to partners?

A With so much of upheaval in geo politics happening around, it definitely has impacted the surveillance markets not only in India but globally also. Today the users are more discerning about their safety and security and hence we witness the cameras hovering around us in all aspects of life and places. Be it schools, colleges, shops, hospitals, airports, railway stations and not to spare areas like elevators, common rooms in residences etc. Today the tech development happening is a combination of both hardware and software and incorporating the AI and ML is just not a buzz word anymore. With all of these factors, the market will see an upward trend for next at least half a decade. With government' initiative on localisation of data and manufacturing, the demand for such products will intensify. My message to partners is very simple, understand the customers need and provide a total solution rather than just selling the products. As today customers are not only educated in terms of needs but also informed as almost every customer today has someone who is tech guru. Partners today need to be updated both in terms of tech and market dynamics. **d**
