

Plan & design for security

Map, measure and secure to build safe networks
from day zero

Most Indian MSMEs still wire their workplaces the way they set up home Wi-Fi – buy a router, plug in a switch, share passwords – and hope nothing breaks. This chapter flips that approach. You'll start with Zero Trust design fundamentals, sketch a physical-plus-logical blueprint, heat-map every square metre of office space, and finally power-budget every PoE port and UPS watt. By the end, you'll know exactly where every cable, mesh node, and watt of backup power belongs – and why.

Why “Secure-by-Design” beats After-the-Fact patching

Indian MSMEs contribute roughly a third of the nation's GDP, but 57% of reported cyber-incidents last year involved networks under 100 seats. Attackers love small offices because they bank on speed: why burn a zero-day on a Fortune 500 when an unpatched router at a 15-seat SaaS startup gets you payroll data in minutes? Zero Trust flips that narrative by assuming every request – internal or external – is hostile until proven otherwise.
