

12 > Ace your 2026 productivity resolutions

You've now turned "I should plan my week better" into a semi-automated ritual that takes ~15 minutes.

2. Prioritise smarter: Let ChatGPT sort it out

We're all drowning in tasks. The trick isn't doing everything; it's choosing the right next few things. AI can apply frameworks like Eisenhower matrix (urgent/important) or MoSCoW (must/should/could/won't) to your list.

Dump your brain, then ask AI to structure it

First, do a raw brain dump (no order, no guilt):

- "Finish slide deck for Tuesday client meeting"
- "Book dentist"
- "Draft AI resolutions article intro"
- "Renew car insurance"
- "Backup photos"
- etc.

Now prompt:

"Here is my messy to-do list:

[paste list]

1. Group tasks by category (Work, Personal admin, Health, Family, etc.).
2. Within each category, classify tasks using the Eisenhower matrix:
 - Urgent & Important
 - Important but Not Urgent
 - Urgent but Not Important
 - Neither urgent nor important
3. For each category, suggest the top 3 tasks I should focus on today and briefly justify why.
4. Then create a short 'Today' list for me, limited to 5–7 tasks total."

You'll get a much cleaner view:

- **Today (Max 7):**
 - Finish slide deck
 - Draft AI article intro
 - Book dentist (deadline this week)
 - etc.

Turn "someday" into scheduled tasks

For the "Important but Not Urgent" pile, ask:

"For these Important-Not-Urgent tasks, propose when in the next 4 weeks I should do each, considering my typical weekday routine we created earlier. Output as: Task – Suggested Date – Suggested Time Block."

Now you literally have a roadmap instead of a guilt list.

Micro-prioritisation: "What should I do in the next 30 minutes?"

When you feel overwhelmed mid-day:

The Eisenhower Decision Matrix

"Given this current list of tasks and that I have uninterrupted 30 minutes now, which one task will give me the highest leverage or reduce most stress if completed? Explain in 2–3 lines."

Let AI talk you into the most impactful task instead of the easiest one.

3. Automate reminders and calendar syncing

AI-designed schedules are great, but they need automation to actually nudge you.

Most assistants (Google Assistant/Gemini, Siri, Alexa) integrate with calendars and reminders. Google is increasingly weaving Gemini into Workspace to help manage tasks, draft emails and summarise docs.

We'll keep things tool-agnostic, but assume you have:

- A calendar app (Google Calendar, Outlook)
- A reminders/to-do app (Google Tasks, Apple Reminders, Todoist, etc.)
- An AI assistant on phone (Gemini/Google Assistant, Siri, or similar)

From AI plan to real reminders (step-by-step)

Continuing from Section 1:

1. Take your AI-generated weekly plan (with deep work, workout, learning blocks).
2. For each block, create a recurring calendar event:
 - Title: "Deep Work – No Meetings"
 - Time: e.g. Mon–Fri 11:00–13:00
 - Set notification 10 minutes before.
3. Add reminders for key one-off tasks AI highlighted (e.g. "Call dentist").

You can use voice:

- "Hey Google, remind me to call the dentist tomorrow at 11am."
