

- “Hey Siri, every weekday at 9:15 remind me to review my top tasks.”

Using AI for calendar triage

When your week gets messy with meetings, forward a screenshot or text list to ChatGPT/Gemini:

“Here is my calendar for tomorrow: [paste agenda text].

1. Identify which meetings look skippable or could be turned into async updates.
2. Suggest where I can carve out at least one 90-minute deep work block.
3. Draft 1–2 polite emails/messages to decline or reschedule low-priority meetings.”

Copy the suggested wording into email/Teams/Slack and send.

Gemini as your scheduling co-pilot (conceptual workflow)

Google has been rolling out Gemini integration into Gmail, Docs and Calendar to help with summarising threads and suggesting actions (like proposing meeting times).

A generic workflow:

1. In Gmail, you have a long thread about “When can we meet?”
2. Use Gemini or your assistant to:
 - Summarise the thread
 - Extract date/time preferences
 - Suggest 2–3 slots based on your calendar
3. Ask AI to draft a reply:

“Draft a concise email proposing these 3 time slots and asking them to confirm one, in a friendly but professional tone.”

You’ve just offloaded 10–15 minutes of mental overhead.

4. Use AI to write emails, take notes

A huge chunk of “productivity” is actually communication management. AI excels at:

- Turning messy notes into clean summaries
- Drafting email responses

- Generating action lists from meeting transcripts

Drafting and polishing emails with ChatGPT/ Gemini

Step-by-step: replying to a work email

1. Copy the email you received.
2. Prompt:

“Here is an email I need to reply to:
[paste email]
I want to say: [briefly describe your intent in bullet points].

 1. Draft a clear, concise reply in [tone: formal/casual/friendly] tone.
 2. Keep it under [X] words.
 3. Offer 2 subject line options if needed.”
3. Paste the AI-drafted reply into your email client, tweak any details, and send.

Tip: Over time, you can create reusable prompts like “You are my email secretary. Always reply in this style...” for consistency.

Summarising meetings from raw notes

If you jot down bullet points during a call (or your team uses a meeting recorder that produces a transcript), AI can convert chaos into clarity.

“These are my rough notes/transcript from a meeting:
[paste notes]

Please:

1. Summarise the meeting in 5 bullet points.
2. Extract a list of action items with owners and deadlines if mentioned.
3. Highlight any decisions made.”

Paste this summary into your project doc, send to attendees, or convert action items into tasks/reminders.

Some tools (Notion AI, Otter.ai, Fireflies.ai) already integrate AI summarisation directly into meeting workflows; you can still use ChatGPT/Perplexity as a second pass for clarity or different formats (e.g. “Turn this summary into an email update for my manager”).
