

Learn a new skill resolution

Use AI tutors to learn faster, deeper, and smarter.

New Year skill resolutions sound glamorous on 1 January and exhausting by 15 January. There's so much to do, like learn Python, get good at data analysis, crack public speaking, or pick up design or video editing.

The problem usually isn't motivation – it's structure and support. There's too many resources with no clear roadmap, and more importantly no one to keep you honest with explanations and constant quizzing.

Now you effectively have three always-on "coaches" in your pocket:

- **ChatGPT Go** – for explanations, study plans and practice

with its new Study mode, designed to give step-by-step guidance instead of just answers.

- **Google Gemini** – with Guided Learning to walk you through problems interactively, plus education-focused features in Gemini for Education.
- **Perplexity** – a research/search engine that can summarise, cite and organise information (including academic papers, PDFs and Spaces for courses).

This chapter is about turning them into a proper personal tutor stack. We'll:

1. Use ChatGPT/Gemini to build structured learning roadmaps
