

2. Quiz yourself and break down tough topics with Perplexity
3. Practice coding, languages and soft skills using AI
4. Use AI for mock interviews and resume sharpening
5. Get AI-curated YouTube/tutorial/course recommendations

1. Use ChatGPT/Gemini for structured learning

Think of ChatGPT/Gemini as your curriculum designer plus explain-like-I'm-five tutor.

Both now have specific education features:

- ChatGPT's Study mode is explicitly built for homework help and exam prep, guiding you step-by-step instead of just spitting out solutions.
- Gemini's Guided Learning mode focuses on gradually building understanding with questions, visuals and quizzes.

We'll keep it generic so it works even if your UI looks a bit different.

Clarify your skill goal in “AI-friendly” terms

Before you ask AI for a roadmap, define:

- **What skill?**
 - “Python for data analysis basics”
 - “Figma for UI design”
 - “Conversational Spanish for travel”
- **Level & timeframe:**
 - From zero → beginner in 8–12 weeks
 - From beginner → intermediate in 6 months
- **Time available per week:**
 - e.g. 5–7 hours/week (1 hour weekdays + 2 on weekend)
- **Output you care about:**
 - Build 1 mini-project / portfolio piece
 - Pass a specific exam (IELTS, certification, etc.)

Write this in bullets. You'll paste it into ChatGPT/Gemini.

Design a realistic learning roadmap

Prompt (to ChatGPT or Gemini)

“Act as an experienced teacher. I want to learn [skill].

Context about me:

- Current level: [absolute beginner / some experience]
- Goal: [e.g. build basic data analysis projects / hold 10-minute conversation in Spanish]
- Time: [X hours/week] for [Y weeks]
- Learning style: [videos / reading / hands-on exercises]

Please:

1. Create a [8/12]-week learning plan broken into weekly themes.
 2. For each week, specify:
 - Topics to learn
 - Concrete outcomes (“I should be able to...”)
 - 2–4 practice tasks or mini-assignments
 3. Include a simple final project in the last 2 weeks.
 4. Keep the workload realistic for a working professional/student.”
- You'll get something like:

- Week 1: Basics of [skill], environment setup, first tiny exercise
- Week 2: Core concepts
- Week 3–4: Applied mini-projects
- Week 5–6: More complex tasks
- Week 7–8: Final project & revision

Turn the roadmap into weekly “micro-sprints”

Now ask your AI tutor to zoom in.

“Now break Week 1 into 3–5 study sessions of about 45–60 minutes each.

For each session, list:

- Topic
- Short explanation
- Suggested resource type (video/text/practice)
- One practice task I must complete.”

Do this for Week 1 and Week 2 only. Don't over-plan; you'll adjust later.

Practical move:

Create a note titled “Skill – Week 1 Plan” and paste those sessions. Each day, you tick one.

Get step-by-step help

When you're stuck on a specific concept (say loops in Python, or present perfect in English), don't just ask for the answer.

Use the “learning” modes:

- **In ChatGPT (Study mode):** choose “Study and learn” and then:

“Explain [concept] with a simple analogy first.

Then give me 3 practice questions, one at a time, and wait for my answer.

If I'm wrong, explain why and give a simpler example.”
- **In Gemini (Guided Learning):**

“Walk me through this problem step-by-step. Ask me questions at each step and don't reveal the final answer until I've tried.”

This converts AI from “answer vending machine” into Socratic tutor.
