

20 > Learn a new skill resolution

- Then give feedback on structure, clarity and relevance.
- Occasionally ask follow-up questions to go deeper into my experiences.

Use a realistic, slightly challenging tone.”

You answer out loud (ideally recording yourself), then paste a rough transcript of what you said into the chat.

Then ask:

“Here is roughly what I said. Rewrite it into a strong, concise answer following the STAR format (Situation, Task, Action, Result).”

You learn to upgrade your stories and see what a sharp version sounds like.

Skill-specific interviews

If your new skill is technical (e.g. SQL, Python, design), ask for domain-specific practice:

“Ask me 10 progressively harder interview questions on [topic]. For each one, after I answer, tell me:

- What I did well
- What I missed
- How a top-tier candidate might phrase the answer.”

You’re essentially getting infinite mock interviews without booking a friend.

5. AI-curated YouTube/tutorial/course recommendations

The internet already has more courses and playlists than you can handle. The trick is getting a curated subset that matches your level and roadmap.

Ask for resource recommendations aligned to your plan

Once you have the 8–12 week roadmap (Section 1), ask:

“Using this learning plan:

[paste weekly outline]

Suggest:

1. 3–5 high-quality YouTube playlists or channels that align with this roadmap.
2. 2–3 online courses (free or low-cost) suitable for my level.

3. 3–5 practice platforms or websites (e.g. coding challenge sites, language practice sites) to apply what I learn.

For each recommendation, include 1–2 lines on why it’s a good fit.”

ChatGPT/Gemini can search or rely on their training to produce solid lists. Perplexity, which is used heavily by educators for research discovery and up-to-date links, is particularly good at this and will cite sources.

Use Gemini for Education contextually

Google’s Gemini for Education initiative focuses on helping teachers and learners create personalised learning experiences and save prep time.

Practical use for an individual learner:

“I’m self-studying [skill].

1. Suggest how I can turn my existing lecture slides/PDF into a structured study guide.
2. Propose a weekly review quiz format I can re-use.”

Upload or paste your materials; Gemini can help chunk content into lessons and quiz questions.

Build “resource packs” with Perplexity Spaces

For bigger skills (e.g. “GenAI for marketing”, “cloud fundamentals”):

1. Create one Space per topic/module.
2. Inside each Space, ask:
“Find 5–10 high-quality introductory resources (articles, docs, videos) on [subtopic], with a one-line summary and difficulty tag (Beginner/Intermediate).”
3. Over time, you can ask Perplexity to re-use these resources to generate revision notes and tests.

Now your content firehose becomes a curated library.

Learning in 2026 is less lonely

The biggest difference between “I’ll learn X this year” and actually learning it is consistent, structured practice with feedback.

AI won’t magically install skills in your brain. But it can:

- Turn fuzzy goals into weekly study roadmaps
- Give step-by-step explanations instead of cryptic answers
- Generate quizzes, flashcards and practice tests from your own materials
- Role-play tutors, interviewers and conversation partners
- Help you present your new skills better to the world (resume + interviews)

If you only do one thing after this chapter, make it this:

Pick one skill and ask your AI assistant to design a 4-week learning plan with daily/weekly tasks, then actually follow it and review together each week.

Once you feel what it’s like to have a personal AI tutor, you’ll realise your 2026 skill list doesn’t have to stay stuck on a mood board. 📌
