

22 > Let AI plan trip resolutions

feature powered by Gemini that lets you describe the kind of trip you want in natural language (“mountains and good food in spring”) and then surfaces destinations and live flight options that match.

Step-by-step (conceptual flow):

1. Open Gemini app or the new AI Mode in Search.
2. Type something like:
“I’m based in [your city]. I have ₹60,000 for flights and stays. I want a 5–7 day trip between March and May, with:
 - Mountains or hills
 - Good vegetarian food
 - Not insanely crowdedSuggest 5 destinations (India or nearby countries) that fit, with rough flight costs and why each place matches this vibe.”
3. Gemini / AI Mode will:
 - Parse your preferences
 - Suggest a shortlist of destinations
 - Tie recommendations to real-time flights via Google Flights data.
4. Ask follow-ups to narrow further:
“Which of these 3 is most budget-friendly for 6 nights including mid-range stay?”
“Which one has better weather in April?”
You now have a shortlist instead of an infinite internet.

Use Perplexity Travel for curated ideas

Perplexity has launched Perplexity Travel and dedicated “Trip Planner Pro” Spaces to generate itineraries and surface destinations, backed by live web data and travel partners like Tripadvisor.

Workflow:

1. Go to Perplexity and switch to Travel (or open a travel Space like Trip Planner Pro).
2. Prompt:

“I’m travelling from [city] with a budget of ₹80,000 for a 7-day international trip in September. I like:

- Walkable cities
- Good street food
- Some culture (museums/old towns) and some nature

Suggest 4–5 destinations with:

- Rough flight cost range
- Average daily budget
- 1–2 must-do experiences each.

Add links to 1–2 solid travel guides or blogs for each option.”

3. Perplexity will aggregate info from blogs, OTAs, tourism boards and show you sources and often a small curated guide per city.

4. Ask for a comparison table:

“Turn this into a comparison table with columns: Destination, Flight cost range, Best month window, Pros, Cons.”

Now you can actually choose instead of doom-scrolling “best places to go in 2026”.

Use ChatGPT as a personal travel counsellor

Even generic ChatGPT (or a dedicated Trip Planner GPT) is surprisingly good at the “what should I do with my life (vacation edition)” phase.

“Act as a travel consultant.

- I’m based in [city]
- I want to travel more in 2026, but I’m budget-conscious and introverted.
- I like: [interests]
- I dislike: [loud nightlife / long bus rides / cold weather, etc.]

Suggest:

1. Three ‘easy first trips’ (3–4 days, near home).
2. Two ‘signature trips’ (6–8 days, more planning) I should aim for this year.

For each, give reasons why it fits my personality and budget.”

You’re now playing life-design with an AI that remembers your preferences.

2. Build day-by-day itineraries

Once you’ve picked a destination, the next terror appears: “What do I even do there each day?”

Here’s where the AI stack shines: Gemini for maps + logistics awareness, Perplexity for up-to-date info and guide-style summaries, ChatGPT for story-like itineraries.

Use Perplexity Travel as your skeleton itinerary builder

Perplexity Travel lets you choose from curated guides or generate your own. Testers describe it as “create your own adventure or start from a curated selection of travel guides”.
