

Step-by-step:

1. In Perplexity Travel, ask:
 “Plan a 5-day itinerary for a first-time visitor to [city/country] in [month].
 – I like: [art museums / cafes / hikes / nightlife]
 – I dislike: [extreme sports / long bus rides / tourist traps]
 – Budget: [value] per day excluding flights
 For each day, suggest:
 – Morning, afternoon, evening plan
 – 2–3 restaurant/neighbourhood suggestions
 – How to get between areas (metro/tram/walk, rough time).
 Use recent sources and link the main ones.”
2. Perplexity will output a structured plan with embedded links (Tripadvisor, local blogs, official sites, etc.) and you can see citations.
3. Refine:
 “Day 3 looks too rushed. Remove one stop and suggest a slower version with more food exploration.”
4. Save the answer or export key bits into your notes app.

Use Gemini + Maps data for geospatial sanity checks

Google is integrating Gemini more tightly with Maps and Google Flights. That means you can ask travel-type questions and have them grounded in actual map/route data, not hallucinated distances.

Practical flow:

1. Take the draft itinerary from Perplexity or ChatGPT.
2. In Gemini, paste the Day 1 plan and ask:
 “These are the places I want to visit on Day 1 in [city].
 1. Sort them in an order that minimises backtracking using public transport or walking.
 2. Estimate travel times between them using Google Maps data.
 3. Flag if any time windows are unrealistic (closed on that day, too little time, etc.).”

3. Gemini, grounded in Maps, can flag “This museum is closed on Monday” or “This combo will mean 1.5 hours of transit”.
4. Adjust Day 1 based on this routing.
 Repeat for each day. You’re basically letting Gemini be the itinerary reality-check engine.

Use ChatGPT for “theme-based” days

Maybe you want a “hidden cafes” day, a “history day”, or a “kids-friendly” day.

“Act as a local-style travel planner.

I will be in [city] for 5 days in [month]. I want to design themed days:

- 1 ‘classic sights’ day
- 1 ‘food & cafes’ day
- 1 ‘local neighbourhoods’ day
- 1 ‘day trip’ outside the city
- 1 ‘slow last day’

Suggest an itinerary for each day with 3–5 stops, rough timings, and 1–2 backup options if something is closed or rained out.”

You now have narrative days instead of just a bucket list.

3. Ask AI for travel hacks, tips

Once the destination and skeleton itinerary are done, we enter the logistics & hacks zone.

Smart packing lists that actually match your plan

Generic packing checklists are fine, but AI can factor in climate, activities and accommodation type.

“Create a packing list for a [7-day] trip to [destination] in [month].

- I’m travelling from [origin climate]
- Activities: [hikes, city walks, 1 fancy dinner, beach]
- Staying in: [hotels/hostels/Airbnb] with [washing machine / no laundry]
- I want to pack light: only 1 cabin suitcase + backpack.

Group items as:

- Clothing
- Toiletries
- Tech & cables
- Documents & money
- Health & safety

Mark items as ‘essential’ vs ‘optional’. Include India-specific items if relevant (adapters, medicine brand examples, etc.).”

If you’re travelling with kids/elderly:

“Now adapt this list for travelling with a [4-year-old] (add specific kid items).”

This gives you a personalised list you can DUPLICATE for every future trip with minor tweaks.
