

Get Healthier with AI

Use AI to plan, track and transform your health

You and I both know how New Year health resolutions usually go.

Week 1: “New me” energy.

Week 3: “New excuses” energy.

The missing piece isn’t information (the internet is drowning in diets and workouts). It’s a guided, personalised, low-friction system that helps you plan, adapt and stay accountable. That’s exactly where AI shines.

In this chapter, we’ll treat tools like ChatGPT Go, Google Gemini, and Perplexity as a personal wellness team:

- ChatGPT / Gemini → coach + planner + motivator

- Perplexity → fact-checker + research assistant
- Existing health apps → sensors + trackers that feed the real-world data

We’ll walk through step-by-step workflows so a reader can literally pick a goal (lose weight, get fitter, eat better, reduce stress, sleep more) and plug it into AI.

IMPORTANT
AI is not a doctor or therapist. For diagnosis, medication, or serious mental/physical health issues, always consult a qualified professional. AI is best used for planning, education, reminders and motivation, not medical decisions.

1. Plan smarter workouts with ChatGPT Go and Gemini

Think of ChatGPT/Gemini as a friendly trainer who never gets tired of questions. The key is to feed context and iterate.
