

Set your fitness goal the AI way

Before asking AI for a plan, decide:

- **Primary goal:**
 - “Lose 5 kg in 4 months”
 - “Run 5 km without stopping by June”
 - “Build upper-body strength at home, 3 days a week”
- **Constraints:**
 - Equipment (none / dumbbells / full gym)
 - Time (20 mins/day, 45 mins/day, etc.)
 - Injuries/limitations (knee pain, back issues)
- **Current level:** absolute beginner / somewhat active / regular exerciser

12-week workout outline

You can literally copy–paste this and tweak:

Prompt to ChatGPT/Gemini

“Act as a certified fitness trainer. I am a [age]-year-old [gender] with [current fitness level, e.g. sedentary / walk 3–4k steps] and no major medical issues except [mention any].

My goal is to [lose X kg / run 5K / build strength] in the next 12 weeks. I can work out [X] days per week for [Y] minutes per session. I have access to [no equipment / dumbbells / full gym].

1. Create a 12-week progressive workout plan with 3 phases (easy, moderate, harder).
 2. For each week, list the days, exercises, sets/reps or duration, and approximate intensity.
 3. Include 5–10 minutes of warm-up and cool-down suggestions each day.
 4. Explain any unfamiliar exercise briefly so a beginner can understand.
 5. End with a short “listen to your body” safety reminder.”
- You’ll get a table-style plan or a week-by-week breakdown.

Turn the AI plan into a daily routine

Once you’ve got the 12-week outline:

Step-by-step: converting plan to routine

1. Paste Week 1 back into ChatGPT/Gemini and say:
“Convert this Week 1 plan into a simple day-by-day checklist I can paste into my notes app.”
2. Ask for beginner-friendly variants if something feels intimidating:
“Replace any high-impact moves with low-impact options that are kind to my knees.”
3. Ask for a 5-minute warm-up script you can follow:
“Give me a 5-minute warm-up routine, step by step with timings, suitable for indoors without equipment.”
Add to your phone’s Notes / Tasks / Calendar so each day shows:
 - Warm-up
 - Main workout
 - Cool-down

4. After Week 1, return with feedback:

“I finished Week 1 but the leg day felt too intense. Adjust Week 2 to reduce leg volume by 20% and increase rest time.”

This “conversational periodisation” is something you’d rarely get from generic workout apps.

2. Meal plans using AI nutrition guides

Most diets fail not because they’re wrong, but because they’re too generic or too hard to stick with in real life. Here’s where AI can help design something that fits your routines, food culture and budget.

Define your food context

Before prompting AI, decide:

- **Diet type:** veg / non-veg / vegan / eggitarian
- **Cuisine comfort zone:** Indian home-cooked, mixed, minimal cooking, etc.
- **Constraints:** budget, time to cook, food allergies, dislike for certain foods

7-day practical meal plan

Prompt to ChatGPT/Gemini

“Act as a nutrition coach familiar with Indian food. I am a [age]-year-old [gender], [height], [weight]. My goal is to [lose fat / maintain weight / gain muscle] at a healthy pace. I prefer [veg/non-veg/mixed], mostly [North Indian/South Indian/etc.] home food.

1. Estimate my daily calorie range and macro split suitable for my goal.
2. Create a 7-day meal plan with breakfast, lunch, snack, and dinner each day.
3. Use simple Indian recipes and common ingredients. Avoid [your allergies or dislikes].
4. Keep prep time reasonable for a working professional (≤30 minutes per meal where possible).
5. For each meal, add an approximate calorie range and 1–2 tips to make it healthier.”

You’ll get a structured plan like:
