

■ Day 1:

- Breakfast – oats with curd and fruits
- Lunch – dal, roti, sabzi, salad
- Snack – chana + buttermilk
- Dinner – grilled paneer + stir fry veg

Use Perplexity to sanity-check nutrition

Now you want to make sure the plan is not nonsense.

1. Take one sample meal, e.g. “one cup cooked dal + two rotis + sabzi + salad”.
2. Ask Perplexity:
“Roughly how many calories and grams of protein are in: one cup cooked dal, two medium wheat rotis with a teaspoon of oil each, one cup mixed vegetable sabzi (lightly cooked in oil), and a bowl of salad? Please show sources.”
3. Perplexity will answer with an approximate calorie/protein breakdown and links to nutrition databases (USDA, Healthline, etc.).
4. Compare that to what ChatGPT/Gemini estimated. If the AI coach under- or over-estimated, you can adjust your overall daily calories or portion sizes.
5. You can also ask Perplexity:
“What is a safe weekly weight loss target for a [age]-year-old [gender] of [weight/height]? Show references from reputable health organisations.”

This ensures your plan stays realistic and safe, not crash-diet territory.

Ask AI for batch cooking + grocery list

To actually follow the plan:

“From this 7-day meal plan, create:

1. A consolidated grocery list for 1 week for one person. Group items by category (grains, pulses, vegetables, dairy, spices).
2. A Sunday meal prep plan so I can pre-cook or partially prep items for the week in 2–3 hours.”

Now you’ve got:

- A clear shopping list
- A Sunday prep schedule (par-boil veggies, cook bulk dal, chop salad bases, etc.)

Drop that grocery list straight into your notes app or a shopping app.

3. Validate fitness tips and track progress

The internet is full of “Do this one hack to lose 20 kg in a month” nonsense. Perplexity is a good way to help you cut through some of that bro-science.

Bust health myths with sources

When you see a viral tip (“never eat rice after 7 pm”, “this supplement burns fat”), feed it to Perplexity:

“Is it evidence-based that [claim]? Summarise what reputable sources say, and link to them.”

You’ll typically get:

- A short summary (“research doesn’t support this exact claim but...”)
- Links to organisations like WHO, CDC, Mayo Clinic, academic articles, etc.

This lets you separate TikTok trends from actual science before adding a hack to your routine.

Basic progress tracking with AI

You don’t need a smart scale if you don’t want one, but at least track:

- Weight (weekly)
- Waist measurement (bi-weekly)
- How you feel: energy, sleep, mood

Simple spreadsheet + AI combo:

1. Use Google Sheets/Excel with columns:
 1. Date
 2. Weight
 3. Waist (cm)
 4. Steps that day
 5. “Notes” (energy, sleep, etc.)
2. At the end of 4 weeks, export values or copy into ChatGPT: “Here is my 4-week progress data as a table: [paste].”
 1. Describe the overall trend in weight and waist.
 2. Point out any interesting patterns (e.g., bad sleep correlating with weight spikes).
 3. Suggest 3 small data-driven adjustments to my workouts or diet.”
3. Use Perplexity if you want research-backed reasoning:

“I noticed that weeks with less sleep seem to correlate with higher weight or cravings. Summarise what research says about sleep and weight regulation and link sources.”

Now you’re not just “feeling” progress – you’re seeing patterns with AI help, and adjusting intelligently.

4. Mental health and mindfulness support

Again: AI ≠ therapist. But it can help with:

- Mindfulness exercises
