

8 > Get Healthier with AI

- Journaling
- Structuring your thoughts before you talk to a professional

Use ChatGPT/Gemini as a guided mindfulness script writer

You can ask for custom meditations tailored to your mood.

“Act as a mindfulness coach. I feel [anxious/stressed/can’t focus] because of [brief context].

1. Write a 10-minute guided meditation script I can read or record in my own voice.

2. Focus on breathing, grounding in the body, and self-compassion.
3. Make the language simple, non-religious, and reassuring.”
Then you:

1. Paste this into a notes app and read it slowly each night, or
2. Record yourself reading it as a voice note—now you’ve essentially built your own guided meditation app.

You can also ask:

“Shorten this into a 3-minute version I can use in the middle of a stressful workday.”

Discover mental health resources

If you suspect you need professional help, Perplexity can help you find and compare resources (e.g., online counselling platforms, helplines, clinics) and will usually link to official websites or directories. You can ask:

“List reputable mental health helplines and online counselling platforms available in India, with brief descriptions and official links.”

Use it as a directory, then connect with humans.

5. Habit tracking and daily check-ins

Most resolutions die when we stop checking in with ourselves. AI can be your non-judgmental daily log-book + coach.

Build a 5-minute AI check-in ritual

Pick a time: end of the day, or post-workout.

Use a fixed prompt with ChatGPT/Gemini:

“Every day I will paste a short log like this:

- Sleep: [hours, quality]
- Movement: [steps, workout, etc.]
- Food: [on plan / off plan, any cravings]
- Mood: [1–10 + 1 sentence]

When I paste it, do three things:

1. Give me a 3-line empathetic reflection.
2. Point out one thing I did well today.
3. Suggest one tiny improvement for tomorrow only (no guilt, no perfection talk).

Don’t repeat long explanations every day.”

Workflow:

1. Create a shortcut note template in your phone like:
 - Sleep:
 - Movement:
 - Food:
 - Mood:
2. At day’s end, fill it and paste into ChatGPT/Gemini.
3. Read the response; if something resonates, copy one actionable suggestion into tomorrow’s to-do list.
Over weeks, this becomes a powerful micro-coaching loop.

Weekly review with AI

Once a week, ask:

“Here are my last 7 daily logs.

1. Summarise recurring patterns (e.g., late-night snacking, low energy days).
2. Suggest 3 experiments I can try next week to improve my health metrics.
3. Turn those into a simple weekly challenge card.”
Paste the AI’s “challenge card” as your Week X goals in Notes or planner.

6. AI-enhanced health apps & workflows

AI chatbots are the “brain”, but you still need sensors and habit containers. Here’s how to pair them.

(Specific app availability/features change fast; treat the names as examples and focus on the workflows.)
