

Movement: steps, workouts, and form

- **Phone / smartwatch health app** (Google Fit, Apple Health, Samsung Health etc.) to track steps and activity.
- **A workout app with AI coaching** (e.g., apps that adjust difficulty based on your performance, or use your camera to count reps/form).

Workflow:

1. Let your app log steps, workouts, heart rate.
2. Once a week, export or screenshot summary data.
3. Ask ChatGPT:
 “Here is my weekly activity summary. Interpret it like a coach for a beginner. Is this enough to support my health goal of [X]? Where should I level up or down next week?”

Food: logging without going mad

- If detailed logging overwhelms you, do photo journaling:
 - Take pictures of main meals.
 - At day’s end, describe them to AI:
 “Today I ate: 2 idlis with chutney, office canteen rajma-rice, evening samosa, home-made roti/veg/salad. I want to reduce junk by 20%. Suggest what I can swap or tweak tomorrow, keeping my routine realistic.”
- For those who enjoy tracking, pair:
 - Calorie tracking app (MyFitnessPal/HealthifyMe/etc.)
 - With AI analysis: weekly export → “Spot patterns and suggest changes.”

Mind and sleep: basic hygiene with AI nudges

- Use your phone’s bedtime mode / focus mode plus a simple AI plan:
 “Design a 30-minute pre-sleep routine for me that reduces screen time and helps me wind down, including 10 minutes of stretching and 5 minutes of journaling.”
- Save this as a checklist note. Set a recurring reminder.
- After one week, tell AI what you actually followed and ask:
 “Here’s what I actually managed in my bedtime routine vs the original plan. Adjust it to be more realistic while still improving my sleep.”

Example: End-to-end “Get Healthier with AI” workflow

Let’s tie it all together for a typical reader whose resolution is:
“Lose ~5 kg, feel fitter, and sleep better in 3–4 months.”

Step 1 – Design plan (one-time, AI-heavy):

1. Use ChatGPT/Gemini to generate a 12-week workout plan (Section 1).
2. Use ChatGPT/Gemini to generate a 7-day rotating meal plan (Section 2).
3. Use Perplexity to validate safety and calories at a high level.

Step 2 – Set up tracking (one-time):

1. Enable step/activity tracking on phone/watch.
2. Create a simple Google Sheet with weight/waist/sleep/mood columns.
3. Create your daily check-in template for AI journaling.

Step 3 – Daily routine (5–10 minutes of AI + behaviour):

1. Follow the day’s workout from the plan.
2. Follow the meal plan roughly (it’s okay to substitute; later you can ask AI how to adjust).
3. Do the 5-minute AI check-in at night (Section 5): paste your daily log, get one micro-improvement.

Step 4 – Weekly review (20–30 minutes):

1. Update sheet with weekly numbers.
2. Ask ChatGPT: “Analyse this week vs last week. Did I move towards my goal? Suggest 3 tweaks.”
3. Ask Perplexity if you want deeper, science-backed answers on a specific issue (e.g. cravings, plateau, sleep).
4. Adjust next week’s puzzle pieces: maybe add one walk, reduce one junk snack, shift workouts to mornings, etc.

Step 5 – Monthly reset:

1. At the end of each month, ask:
 “Summarise my last 4 weeks’ health journey from these logs and data: [paste]. Celebrate wins, note realistic improvements, and suggest a fresh 4-week challenge.”
2. Print or pin that “4-week challenge” somewhere visible.

Wrap-up: Health resolutions are hard

The biggest advantage of using AI as a wellness coach isn’t that it knows a million exercises or diets – that information is everywhere. The real advantage is that:

- It’s always available,
- It’s patient,
- It can adapt plans to your actual life, and
- It can turn vague intentions into clear, repeatable workflows.

Chapter 1 sets the foundation: body, food, mind, and habits. In the next chapters, you’ll apply the same pattern – goal → context → AI plan → daily/weekly check-in → adjust – to productivity, learning, travel, creativity, and money.

For now, if a reader does just one thing after finishing this chapter, it should be this:

Ask your AI assistant to design your next 7 days of health — workouts, food, sleep routine — in a way that feels achievable, not heroic. Then actually follow it and review together in a week.

That’s how “new year, new me” starts turning into “new system, same me, much better outcomes.” **d**
