Sleep as Android

A good night's rest can dramatically impact energy, focus, and overall health. Sleep as Android uses your phone's sensors – or a compatible smartwatch – to track sleep patterns and wake you when you're in a light sleep phase, reducing grogginess.

1. Install & Grant Permissions

- Allow access to your device's microphone and motion sensors for accurate monitoring.
- If you have a smartwatch, pair it for improved sleep tracking.

2. Set a Smart Alarm

- Choose a wake-up window (e.g., 30 minutes before your usual alarm).
- The app detects the lightest sleep phase in that window to trigger the alarm.

3. Sleep Tracking

- Place your phone on the mattress near your pillow if you're not using a smartwatch.
- Sleep as Android logs movement, snoring, and possible sleep talk.

4. Review Your Reports

- Check graphs of your sleep stages: deep, light, REM.
- Identify patterns such as irregular bedtimes or interrupted sleep.

Pro Tip: Enable the "Anti-Snoring" feature. The app will gently vibrate or play a sound if it detects snoring, nudging you to change position.
