

24 > Optimise devices for better performance

- **iOS:** Settings > General > Background App Refresh.
- **Restrict Autostart Apps:**
 - Use app management settings to prevent apps from starting automatically.

2) Maximise your laptop and PC performance

Computers can slow down due to software clutter, outdated hardware, and resource-heavy applications. Enhancing your PC's performance can lead to a smoother and more efficient experience. Here's how...

Clearing out system clutter

Over time, computers accumulate unnecessary files that take up space and slow down performance.

Using disk cleanup tools

- **Built-in Utilities:**
 - **Windows:**
 - **Disk Cleanup:** Start > Search 'Disk Cleanup' > Select Drive > OK.
 - **Storage Sense:** Settings > System > Storage > Configure Storage Sense.
 - **macOS:**
 - **Manage Storage:** Apple Menu > About This Mac > Storage > Manage.
 - **Empty Trash Automatically:** Enable in the recommendations.
- **Third-Party Software:**
 - **CCleaner:** Cleans temporary files and system caches.
 - **CleanMyMac X:** Optimizes macOS performance (paid software).

Removing unused software

- **Uninstall Programs:**
 - **Windows:** Settings > Apps > Apps & Features > Select App > Uninstall.
 - **macOS:** Drag applications from the Applications folder to the Trash.
- **Use Uninstaller Apps:**
 - Ensure all related files are removed to free up space.

How to improve system speed

Hardware upgrades and system adjustments can significantly enhance your not-so-new laptop or PC's overall performance.

Upgrading RAM and SSD

- **Increase RAM:**
 - **Benefits:** Improves multitasking and performance in memory-intensive applications.
 - **Compatibility:** Check your system's maximum RAM capacity.

- **Switch to an SSD:**

- **Benefits:** Faster boot times, quicker application launches, overall snappier performance.
- **Installation:** May require cloning your existing drive or a fresh OS install.

Disabling unnecessary startup programs

- **Manage Startup Items:**
 - **Windows:**
 - **Task Manager:** Ctrl + Shift + Esc > Startup Tab > Disable Unnecessary Programs.
 - **macOS:**
 - **System Preferences > Users & Groups > Login Items.**
- **Use 'msconfig' in Windows:**
 - **Run > msconfig > Startup Tab** (for older versions).

How to adjust power settings for different users

Optimising power settings can balance performance and energy consumption based on your needs.

Choose between Power Saver and Performance modes

- **Windows:**
 - **Power Saver:** Reduces performance to extend battery life.
 - **Balanced:** Optimal blend of performance and energy use.
 - **High Performance:** Maximises speed; uses more energy.
- **macOS:**
 - **Energy Saver Preferences:** Adjust settings for better battery life or performance.

How to configure power plans on Windows and macOS

- **Windows:**
 1. **Control Panel > Power Options.**
 2. **Choose or Customise a Power Plan.**
 3. **Advanced Settings:** Adjust sleep, display, and processor power management.
- **macOS:**
 1. **System Preferences > Battery (or Energy Saver).**
 2. **Adjust Battery and Power Adapter Settings.**
 3. **Enable 'Automatic Graphics Switching'** on compatible Macs.

3) How to enhance gaming device performance

Whether you're gaming on a PC, console, or mobile device, optimising performance can lead to smoother gameplay and a better overall experience.

How to optimise graphics and FPS

Higher frames per second (FPS) and optimised graphics settings can make games run more smoothly.
