

Hidden tools in Win11

Most users never use these hidden tools

Windows 11 has a reputation problem. Not because it's bad—because most people only meet it at its worst.

You see Windows when:

- an app crashes five minutes before a deadline,
- your laptop suddenly “feels slow” for no explainable reason,
- a driver update turns your audio into a haunted radio,
- a mysterious pop-up appears and you're not sure if it's a warning or a scam.

And that's when most Indian users do the default ritual: restart, pray, WhatsApp-forward a screenshot to “that friend”, and hope the problem becomes someone else's personality.

Here's the better truth: Windows 11 comes with a serious built-in toolkit for testing suspicious files, isolating risky installs, diagnosing crashes, and automating repetitive

chores—without downloading random “PC Doctor 2026 Pro Ultra” software.

In this chapter, we'll unlock five tools that feel “hidden” only because nobody bothers to introduce them properly:

1. **Windows Sandbox** — a disposable PC inside your PC, for safe testing.
2. **Hyper-V** — full virtualization for power users and developers (Pro/Enterprise).
3. **Event Viewer** — the black box recorder for Windows errors.
4. **Reliability Monitor** — the “what changed?” timeline when things started breaking.
5. **Task Scheduler** — automation without needing to be “a coder”.

The goal isn't to turn you into IT support. The goal is to make you panic-proof: when Windows misbehaves, you know where to look first.
