

Automate your life with Windows

Automate the boring bits with ease

There are two kinds of Windows users. **Type A:** opens the same five apps every morning, downloads the same PDF attachments, renames the same file formats, cleans the same folders, sets the same reminders, and *still* tells themselves they'll "streamline this someday."

Type B: gets Windows to do it automatically and then pretends they're simply "very organised."

This chapter is your conversion therapy from Type A to Type B.

Windows 11 ships with enough automation muscle to make everyday life smoother – without installing suspicious "opti-

mizer" software or living inside command-line tutorials. The trick is to use the right level of automation for the job:

- **Power Automate (Desktop flows):** best when you're automating *clicks, web forms, repetitive UI workflows* – the kind of stuff you'd normally do with a mouse and sighing. Microsoft describes desktop flows as RPA capabilities that automate repetitive desktop processes with drag-and-drop actions or recordings.
- **Task Scheduler:** best when you want a task to run *at a time/event* (daily/weekly/at logon/at startup). Task Scheduler works by monitoring triggers and running tasks when criteria are met.
