

are converging in interesting ways. The future probably looks like one API that lets you choose latency vs cost as a configuration option rather than a fundamental architectural choice.

CDC is becoming the default for syncing data between systems. Tools like Debezium, Fivetran, and Airbyte are making it routine. The era of nightly database dumps is winding down for any team that cares about freshness.

Stream processing in the warehouse is starting to be a real thing. Snowflake Streams, BigQuery continuous queries, ClickHouse materialised views -- all let you do streaming-like work without standing up a separate stream processor. For many use cases, this may be enough.

WebAssembly and edge computing are pushing stream processing to new locations. Tools like InfinyOn are doing event processing closer to where events originate. This will matter more over the next few years.

And, finally, the cost of streaming infrastructure keeps falling. Confluent Cloud, Redpanda Cloud, AWS MSK, all these managed offerings mean teams don't have to operate Kafka themselves to use it. This is genuinely lowering the bar for adoption.

The quiet decisions that shape a platform

The choices between batch and streaming, sub-second

latency and end-of-day freshness, heavyweight processors and lightweight schedulers, and between exotic stream platforms and a well-tuned cron job don't make headlines. They don't get blog posts written about them by the people who made them. But they shape, more than almost anything else, how a data platform behaves under pressure, how much it costs to run, and how often the engineering team gets woken up in the middle of the night. The teams that get this right tend to be the ones that resist the temptation to use the newest tool for every problem, ask hard questions about what freshness means for the business, and build pipelines incrementally rather than betting everything on a big rewrite. If you're building a data platform right now, pick the simplest thing that solves the problem you have, leave room to grow, and don't get talked into streaming everything because somebody on Twitter said the batch is dead. It isn't. It just does a different job. **END** 🐧

Wanna Be Your Own Boss?

DO OPEN SOURCE.

www.opensourceforu.com

Demand for Open Source is sky rocketing. Be it for managing IT infrastructure or development of software--Open Source solutions are what customers are seeking.

All you need to do is develop expertise in an Open Source stack, and then build a team around it!

And, Open Source For You can be your friend and a guide through this journey.
