

The pattern is visible in India's enterprise AI landscape. According to the EY-CII 'AIda of India: Outlook 2026' report — a survey of 200 organisations across more than 20 industries — 47% of Indian enterprises now have multiple genAI use cases live in production, and 76% of business leaders believe AI will have significant business impact. Yet the same report found that more than 95% of those organisations allocate less than 20% of their IT budgets to AI. High adoption confidence, modest infrastructure investment: the integration gap is not a Western phenomenon. Nowhere is it more sharply illustrated than in India's Global Capability Centre ecosystem, where the EY GCC Pulse Survey 2025 found 58% of centres are currently investing in agentic AI and another 29% are planning to within a year — yet BCG research on the same sector found just 5% of AI use cases reaching robust production deployment. The ambition is real. The architectural foundation to support it, in most cases, is still being built.

The AI models available today are genuinely capable. The constraint on enterprise agentic AI is not what they can do in isolation — it is whether the surrounding architecture can support them as they operate in coordination, at scale, in real time. As Deloitte's Tech Trends team put it plainly: "If you just take your existing workflow and try to apply advanced AI to it, you're going to weaponize inefficiency."

Event-driven architecture is the most mature, most battle-tested

answer to that infrastructure challenge currently available. The patterns are understood, the tooling has matured, and the enterprises that have deployed EDA in financial services, logistics, and telecommunications have been operating real-time, event-coordinated systems for years. The question is whether AI teams are having conversations with the integration architects who already know how to build this way.

The foundation determines the ceiling

The organisations that get agentic AI

right do not treat it as a procurement decision. They treat it as an architectural commitment. APIs remain essential — but they are the right infrastructure for a world where AI waits to be asked. Agentic AI needs to know when to act, not just how.

Building that event-driven foundation is the work that separates enterprises who will scale autonomous intelligence from those who will spend the next three years re-platforming after their first generation of agents never reaches production. The foundation determines the ceiling. Build accordingly.
