

Sarvam becomes India's newest unicorn

Bengaluru-based AI startup Sarvam has become India's newest unicorn after raising US\$ 234 million in a Series B funding round led by HCLTech, which invested US\$ 150

million and helped propel the company's valuation to US\$ 1.5 billion. The round also attracted participation from Bessemer Venture Partners, Khosla Ventures and Peak XV Partners, with Sarvam planning to expand the raise to US\$ 300 million.

The milestone highlights growing investor confidence in India's open source AI ecosystem. Since raising US\$ 41 million in seed and Series A funding two years ago, Sarvam has released indigenous open source foundation models with 30 billion and 105 billion parameters, positioning itself among a select group of Indian companies developing large-scale AI models.

Unlike many AI startups focused primarily on applications, Sarvam is building a full-stack AI platform spanning foundation models, inference infrastructure, enterprise software, agentic AI platforms, speech AI and document AI. Its solutions target Indian-language applications as well as banking, insurance, government and defence sectors.

The company reports more than 2 million conversational AI interactions and around 10 million inference API calls daily. Its speech models process over 500,000 hours of speech each month, while its document AI systems have digitised more than 35 million pages.

Sarvam's multilingual voice agents have enabled the Ministry of Agriculture and Farmers Welfare to collect information from 17 million farmers, while a nationwide insurance initiative supported the renewal of 45 million policies. A major fintech company is also using its agentic AI platform to support more than 350,000 sales employees.

The new funding will support research into next-generation AI models, agentic systems, coding and cybersecurity AI, alongside expanded compute infrastructure.

"The aim is to spread this technology in India and bring value to citizens, small businesses, enterprises, and state and central governments in the country," said Vivek Raghavan, co-founder of Sarvam.

Verified OSINT datasets to be integrated into Swarmer's drone AI systems

Swarmer and Molfar Intelligence have entered into a strategic data partnership that

will integrate verified Open Source Intelligence (OSINT) datasets into Swarmer's autonomous drone AI systems, strengthening AI model training, object recognition accuracy, situational awareness, and decision-making reliability.

Under the agreement, Molfar Intelligence will provide structured OSINT datasets comprising geolocated imagery, video intelligence, satellite-derived observations, battlefield activity data and military equipment observations. The information is gathered from publicly available sources, including drone footage, social media, satellite imagery and battlefield reporting.

BHASHINI to power GeM in 22 Indian languages

The Digital India BHASHINI Division (DIBD) and the Government e-Marketplace (GeM) have signed a Memorandum of Understanding (MoU) to strengthen multilingual digital capabilities across India's public procurement ecosystem.

The partnership aims to eliminate language barriers in government procurement by integrating AI-powered language technologies into the GeM platform, allowing users to access procurement services in their preferred languages.

Launched under the 'BHASHINI for Seva/Sanchalan – A BHASHINI Sahayogi Program', the initiative is designed to improve accessibility and participation in public procurement for buyers, sellers, MSMEs, startups, and entrepreneurs across the country.

The collaboration will leverage BHASHINI, India's national language digital public infrastructure, extending its capabilities into procurement workflows through AI-powered language services. The technology stack will enable multilingual interaction, voice-first experiences, and generative AI-enabled services to simplify engagement with government procurement systems.

The platform will support seamless communication across 22 officially recognised Indian languages, along with additional regional languages, helping broaden access to procurement opportunities for businesses operating in diverse linguistic regions.

Under the agreement, GeM and BHASHINI will jointly develop multilingual digital resources through initiatives including BHASHINI Udyat, Mitra, Appmitra, Sahyogi, and Pravakta.
