

Engineering India's Next Manufacturing Renaissance

Can India spark a true manufacturing renaissance by shifting from push-driven tech to pull-driven solutions, powered by simplicity, talent, and open collaboration?

Why do I call it the Indian manufacturing renaissance? Before diving into meaningful innovation in smart manufacturing, let me begin on a lighter note. Imagine wrapping Fitbit around a factory. If factories could express emotions, they would reflect varying energy levels, stress points and operational moods. In many ways, smart factories already help us sense these signals.

However, my focus today is not on smart factories *per se*. The real question is how to harness meaningful, sustainable smart manufacturing for

the Indian manufacturing ecosystem. To set the context, it is important to look at the global manufacturing landscape. Manufacturing has evolved through multiple epochs, from localised precision craft production to today's hyper-connected fourth and fifth waves driven by consumers and social manufacturing models. This evolution frames where we stand and where India must go next.

Where India stands in the global manufacturing evolution

If we are honest with ourselves, India still largely operates in the realm of
