

Democratizing Technology : Cross Pollination of Platforms

- Real Time Transaction Settlement
- Zero Friction PO
- Digital Escrow
- Traceability
- QR Code Management

“Metaphorism in the Technology Stack for Smart Manufacturing”

Figure 3: Integrating UPI with open source technologies

Democratisation, however, has another side. When I explored UPI-related repositories on GitHub, I was surprised to see very limited contributions, despite UPI being central to India's digital economy. This suggests a more serious problem. In spite of having one of the world's largest engineering communities and a wealth of talent, India continues to have one of the lowest rates of open source contributions globally. Access is only one aspect of democratisation. Engineers and institutions must learn to identify real industry problems and actively contribute solutions.

Building the ecosystem for shared innovation

At Endurance, we have built an open source ecosystem that anyone can use. It follows a prosumer model, where users both consume and contribute, and it is freely available to communities and industries. The intent is simple -- to enable collaboration, shared learning, and collective growth rather than isolated innovation.

We examined the global manufacturing landscape and India's position within it, recognising that

Way Forward

- Democratizing Tech. For India
- Fueling Fraternal Economy
- Mission Sustainable Manufacturing

Figure 4: Looking forward to the pathway of resiliency in manufacturing

while push-driven technologies exist, India needs pull-driven solutions built on simplicity, accessibility, and relevance. Real progress lies in marrying existing technologies to solve real problems, not in chasing complexity for its own sake.

The pathway to resilience, in my view, lies in democratising technology, empowering contributors, and turning intelligence into both profit and progress. This is how we create a new renaissance for Indian manufacturing.

I would also like to acknowledge the EFY Expo as a platform that bridges creators and contributors, because meaningful innovation truly begins when technology is not just built, but shared.

This article is based on the talk 'The Indian Manufacturing Renaissance: Turning Intelligence into Profit' by Rahul Chandrashekar, general manager, Endurance Technologies. This opening speech was given at the EFY Expo Gujarat 2025. It has been transcribed and curated by Saba Aafreen, technical journalist at the EFY Group. **END**
