

Red Hat pushes enterprise open source as the core of hybrid AI growth

Red Hat is expanding its open source push in the Philippines, positioning enterprise open source as the backbone of hybrid, AI-driven digital transformation. Its strategy spans hybrid cloud, artificial intelligence, automation, and virtualisation to accelerate enterprise modernisation.

Open source, once viewed as a low-cost alternative, is now a core enterprise model backed by vendors. “Who we are: we are an open source company, and it’s not just about developing software,” said Djang Granados, country manager, Red Hat Philippines, highlighting the company’s focus on enterprise-grade support, stability, and long-term reliability.

Red Hat’s platforms enable organisations to move workloads seamlessly across on-premises systems and multiple cloud environments, addressing flexibility and regulatory needs as most enterprises avoid fully cloud-only models.

GCash demonstrates this shift. The company began its open source journey in 2018 to drive speed and cost efficiency, transitioning to a microservices architecture. “Back in 2018, our open source journey was very, very deliberate,” said Nico Alina, head of infrastructure architecture and enablement, GCash.

Rapid pandemic-driven growth led GCash to adopt a hybrid cloud model in 2022, combining cloud and local infrastructure. Standardising platforms across environments improved efficiency and reduced complexity while strengthening security and compliance. “A big thing for us is really standardising our security and compliance, because trust and security is still our number one priority,” Alina said.

GCash is now integrating AI across systems, aiming to become an AI-native, hybrid multi-cloud organisation while advancing financial inclusion.

According to developers, attackers used a malicious pull request to run a bash script inside a developer account, extracting tokens and signing keys used to publish a near-indistinguishable rogue package.

“Users who installed 0.23.3, or who pulled and ran the affected Docker image, should assume that any credentials accessible to the environment where it ran may have been exposed,” the developers wrote.

The project removed the package within three hours of discovery, rotated credentials, fixed the GitHub Actions flaw, audited related workflows and released a safe version 0.23.4, urging users to upgrade immediately and rotate exposed credentials.

The breach spotlights broader risks in open source repository automation. HD Moore, founder and CEO of runZero, called insecure workflows “a major problem for open source projects with open repos,” adding it is “really hard to not accidentally create dangerous workflows that can be exploited by an attacker’s pull request.”

Zoho invests ₹700 million In India’s open commerce network

Zoho Corporation has invested ₹700 million in Open Network for Digital Commerce (ONDC) to support the development of sovereign technology infrastructure in India and strengthen the country’s open digital commerce ecosystem.

The investment reinforces ONDC’s interoperable open-network model, which allows merchants and customers to connect directly instead of relying on conventional platform-controlled marketplaces. Zoho said the initiative is intended to make digital commerce more accessible and inclusive for businesses of all sizes, particularly MSMEs.

“India’s economy depends heavily on MSMEs, yet they face challenges on all fronts, from limited market access to structural constraints imposed by conventional digital platforms that rarely align with their unique needs. ONDC gives power back to MSMEs, enabling them to expand their customer reach and achieve sustainable growth,” said Sivaramakrishnan Iswaran, CEO, Zoho Payment Technologies.

ONDC enabled 218 million transactions in FY26 and reported a 127% rise in revenue to ₹334.1 million in FY25, although it posted a net loss of ₹1471.3 million during the same period. The non-profit Section 8 company recently appointed Vibhor Jain as MD and CEO.

The network is backed by more than 20 institutions, including National Payments Corporation of India, State Bank of India, HDFC Bank and Protean eGov Technologies.

Red Hat and Nissan push Linux into AI-driven vehicles

Nissan Motor Co. Ltd has selected Red Hat In-Vehicle Operating System as the foundation for its next-generation software-defined vehicle (SDV) platform, placing open source Linux at the core of its future automotive architecture.

Announced during Red Hat Summit 2026, the collaboration centres on Nissan’s next-generation Central Vehicle Computer and its Scalable Open Software Platform (SW PF). The initiative marks Nissan’s shift away from proprietary, hardware-locked automotive systems towards a cloud-native and software-defined vehicle model.

Built on the reliability and security framework of Red Hat Enterprise Linux, Red Hat In-Vehicle Operating System will provide a scalable and standardised Linux foundation capable of supporting automotive software lifecycles spanning decades.

The partnership also enables Nissan to decouple software development from hardware, allowing smartphone-style vehicle feature updates while maintaining automotive-grade safety and security standards. Nissan said the platform would support an AI-native vehicle architecture, where AI-driven workflows could streamline validation cycles and improve developer productivity.
