

Building a Hybrid Book Recommendation System with Open Source Tools

Here's how you can build a recommendation system from scratch for Audible, Amazon's subscription-based audiobook platform.

Recommendation systems have become one of the most impactful applications of machine learning in the real world. Whether it is Netflix suggesting movies, Spotify recommending music, or Amazon predicting what product you may want next, these intelligent engines shape how users interact with massive digital libraries. The same challenge exists in the world of audiobooks.

Platforms like Audible contain thousands of books across genres such as self-help, fiction, business, fantasy, technology, history, and more. With such a huge catalogue, users often face the problem of too much choice. Searching manually for

the next audiobook can quickly become overwhelming.

This is where recommendation engines play a key role:

- Helping users discover books similar to their interests;
- Improving engagement and listening time; and
- Providing personalised suggestions instead of generic bestsellers.

So let's learn how to build an end-to-end hybrid book recommendation system using:

- Natural language processing (NLP)
- Clustering techniques
- Content-based similarity
