

LEEK

Leeks are able to last through snowy weather.

ONION

Bulbs

A bulb is a stem, which holds up the parts of the plant above. It stores water and transports it from the roots beneath to the leaves above.

The bulb grows in spherical layers.

Fibrous roots grow out of the bulb in a tangled bunch.

Fibrous roots

These roots grow downwards and outwards from the main stem of the plant.

The white part of a leek is formed from the bases of its leaves.

SHOOTS AND ROOTS

You only need to look at a chunky carrot and the thin tendrils sprouting from leeks to know that roots come in different shapes and sizes. Noodle-like fibrous roots and thick taproots spread out in the soil beneath vegetable patches.
