

BETROOT

CARROT

The leaves grow above ground.

The round part of a beetroot is its stem.

Bright beetroots take around 120 days to grow.

More roots grow sideways from the main taproot.

Taproots

Carrots and other taproots take up much more space than spindly fibrous roots.

They grow downwards from the middle of the plant, burrowing deep into the soil to find water.

Roots can be cone-shaped.

Sugar is stored in a carrot's taproot. The sugar gives the plant energy to grow.

Taproots grow deep down into the ground.
