

Wheat is measured in bushels (about a million grains).

Field to Fork

Once crops have been harvested, they are taken to be prepared into food. Wheat grains are ground into flour to make bread, pasta, and more!

After wheat, fodder (animal feed) crops might be planted.

Wholemeal flour uses the whole grain. White flour only uses some of it.

Wheat crops

Wheat seeds are planted in the autumn, become rapidly growing seedlings in the spring, and the ripe crop is ready to be harvested (picked) in the summer.

Crop rotation

The countryside is often a colourful patchwork pattern because farmers grow a different crop on the same land each year. This helps to keep the soil fertile.

Wheat was first farmed around 10,000 years ago.
