

There may be as many as 5 million species of fungi, but we haven't found them all yet!

Spores are like miniscule seeds.

Werewere-kokako

This fungus is named after the kokako bird's blue wattle.

Oyster mushroom

Mushrooms can be edible, but many are poisonous!

Field mushroom

Velvet foot

Hen of the woods

Magical mushrooms

A mushroom is the part of a fungus that grows out of the soil to release spores. Wind carries the spores away, which grow into new mushrooms.

Humongous fungus

The largest organism on Earth is a fungus. It spreads out for 8.8 sq km (3.4 sq miles) beneath an entire forest in Oregon, USA.

Fungi don't have leaves, roots, or stems.

Star mushrooms erupt a smoke-like cloud of spores.
