

The background of the page is a stylized illustration of a compost bin. At the top, there are colorful autumn leaves in shades of orange, red, and blue. Below the leaves, a dark, wavy line represents the surface of the compost. A tiger worm, with its characteristic orange and white stripes, is shown crawling along this surface. The worm's body is segmented and has a slightly wavy shape. The overall style is artistic and colorful, with a focus on the worms and their environment.

Tiger worms have a stripy body and no teeth. They have powerful lip muscles and suck food into their mouth.

Tiger Worms

Tiger worms are found in garden compost bins.

Tiger worms eat leaves and scraps of fruit and vegetables.

Mixing it up

Earthworms mix the different soil layers together. This spreads out organic (living or once-living) matter and releases nutrients for soil animals to eat.

WONDERFUL WORMS

They spend their lives hidden from sight, unless you know where to look. Lift the lid of a compost bin to find stripy tiger worms, dig a hole to see pink, green, and even yellow-tailed earthworms, and at the beach look out for wriggly piles of sand made by burrowing sandworms.

Common earthworms are pencil-sized when fully grown.
