

Carnivorous plants such as sundews and butterworts catch flies to eat with their sticky leaves.

Wetland soils

Peat soils in wetlands aren't just home to unique species of plant. They store more carbon than any other soil. If this is released into the air as a gas, it traps heat and can speed up global warming.

This plant is often used to make a herbal tea.

Common butterwort

Walking palm

Murumuru tree

Umbrella thorn tree

Laperrine's olive tree

Euphorbia echinus

Annona purpurea

Lobster claw

Lobster claw nectar is a favourite food of hummingbirds.

There are more than 70,000 types of soil in the USA alone.

GROUND AROUND THE WORLD

A single country can contain thousands of different soils. Plants suited to each soil range from tall trees that look like they have legs (the walking palm) to squat succulents.

Rainforest soils

These are found in warm regions with plenty of rainfall. The soil has few nutrients, but millions of plant species are found there.
