

Saving the planet

A gas called carbon dioxide (CO_2) traps heat in the air and makes our planet warmer. Soils store carbon (found in CO_2), so protecting them could help slow global warming.

The leaves of trees release oxygen.

Foundations

Cracks can appear if part of the house starts to sink.

Houses are built on foundations that are dug into the soil. If the soil becomes unstable then foundations can slip and the house may start to sink.

Food

Many animals need soil-growing plants to eat. In turn, other animals need to eat those animals to survive.

Green spaces

Green spaces are full of plants that absorb CO_2 and release oxygen. Soil creates a sturdy foundation for roots. It provides a store of nutrients and water that plants use to grow.
