

Why Invest in Stocks?

The concept of the time value of money says that money you hold today is worth more than your money tomorrow because of Inflation. Inflation increases prices of the same quantity of goods/services over time and decreases the spending capacity.

Lets say, you are able to buy 50 units for ₹1000. But after one year the value of ● increases due to inflation. Hence you will be able buy less units with the same ₹1000 i.e. your purchasing power decreases with time.

Likewise, hard-earned money left idle in bank accounts will eventually reduce in value, if it is not invested to atleast keep pace with inflation.

That is where stocks can be a valuable part of your investment portfolio. Owning stocks in different companies can help you build your savings, **protect your money from inflation and taxes, grow your wealth and diversify your risk.**
