We see that we can experiment with RSI and many other indicators in terms of time period that is included in calculation. For instance, here we see that we have changed the time frame of RSI from 14 periods to 11 candles. Changes in time period of candles at times changes the timing when the signal is received. However, shortening the time period gives more volatility and false moves. Increasing the length gives more stability but lagging indicator at times. So, we will decide upon a length based on our strategy. With this, we end our discussion on RSI. Lets move to the next indicator.
