

TOOLS TO USE

The technical analysis mainly requires a charting tool, where we can obtain charts from and conduct our analysis. Numerous charting tools are being offered by various service providers. However, the tool to be chosen is based on one that supports most number of indicators, oscillators and also, supports all the functions that we intend to use in our analysis. The tool we select should provide the highest flexibility to conduct operations that we intend to do. We will find both paid as well as free technical analysis tools.

Here, for our analysis, we will use either of the two – Tradingview.com or www.chartink.com.

Tradingview.com is an excellent tool that allows maximum flexibility to conduct our analysis. However, Tradingview requires payment as well. For anyone looking to professionally build a career in the world of technical analysis, we would recommend them to go ahead with Tradingview. On the other hand, for hobby traders, they can use the free website i.e. Chartink.com. These are great to start when we are doing things manually. (We are not tied-up with any of the institutions mentioned here).
