

Automation is becoming a major practice in the field of technical analysis. With the advent of algorithmic trading, where pre-determined algorithms initiate a trade based on conditions, many elements of technical analysis are being automated. Automation is, beyond the scope of this book set and course, as they require a completely different skill-set. When a trader begins automation, they will need advanced tools that will need to be paid for.

As beginners, we must practice the art manually using the above-mentioned tools for at least 6 months. If we move ahead with automation from the very start, we will never understand what is happening in the back-end. Practising manually enhances our ability to create trading strategies and a system.
