

Understanding Screening Criteria:

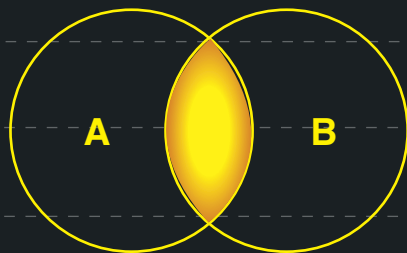

Screens can vary in complexity, ranging from simple to complex setups tailored to specific investment strategies. It's essential to understand that screens are primarily based on numerical data or financial metrics. Therefore, only factors that can be quantified are utilised in screening.

Additionally, it's crucial to understand the logic behind the boolean operators in the screen's conditions. When “**AND**” is used between two conditions, both conditions must be met for a company to appear in the results. Conversely, if “**OR**” is used, meeting either of the two conditions is sufficient for a company to be included in the results.

BOOLEAN OPERATORS

AND

Only results that
contain keywords

OR

Results containing
keywords A or B
