

The Excel data allows for a preliminary understanding of company performance and financial health. By applying common sizing to quarterly numbers and balance sheet items, we gain insights into changes over time. For example, analysing borrowings as a percentage of total assets reveals shifts in financing structures. Similarly, **cash flow statements** offer insights into operational and financial activities. While this overview is useful, it's essential to recognize its limitations and the need for more detailed analysis using data directly from annual reports for comprehensive understanding.

Using Excel data from Screener serves as a starting point for evaluating companies. While it provides valuable insights, a thorough analysis requires delving deeper into financials and operations, which may take days or weeks using data from annual reports. Ultimately, this preliminary analysis helps determine whether further investigation is warranted, laying the foundation for more in-depth analysis in the future.
