

► **BECAUSE** Eoraptor's eyes were set on the side of its head, it couldn't see straight ahead well, but it did have a good all-around view.

The mouth was full of sawlike teeth, ideal for slicing through flesh. Some scientists think Eoraptor may have eaten plants too.

Eoraptor had a shorter neck than the later carnivorous dinosaurs, but its neck was flexible enough for snatching prey from the ground.

Eoraptor only had claws on the three longest fingers of its hands. The other two fingers were shorter but probably helped when searching through vegetation for prey.

▲ **JAWS** Eoraptor had the bladelike teeth of a carnivore—suitable for slicing through meat. It mainly hunted small animals, but may have taken on bigger prey by tearing out lumps of flesh and waiting for its victim to weaken.
