

DID YOU KNOW?

Deinonychus's most famous feature, an enlarged claw on the second toe of its hind feet, provided its name, which means "terrible claw."

▲ THE SECOND CLAW might have been used to disembowel prey, with the predator slicing open the prey's stomach area with a series of raking kicks.

◀ A LIGHTWEIGHT hunter such as *Deinonychus* would have been amazingly agile—a quality it would have needed to dodge the swinging tail and flailing limbs of heavy prey such as *Tenontosaurus*.

◀ *DEINONYCHUS'S* JAWS contained about 60 curved, bladelike teeth, each with a sawtooth edge like the blade of a steak knife. Such teeth were ideal for slicing through tough skin and flesh.
