

FACT FILE

■ BRAIN BOX

All mammals have a large brain relative to their body size. The brain is protected in a hard skull.

Tiger's skull

■ **Hair** Most mammals have hair or fur on their skin to keep them warm.

■ **Young** Rather than laying eggs, most mammals give birth to babies and look after them while they grow and learn.

CARNIVORES

Tiger

Nearly all the members of this family of mammals are meat-eaters. They all share certain features, such as sharp cheek teeth for slicing flesh. Most are intelligent animals and many are ruthless killers.

► HYENA

There are four species (types) of hyena, including the striped hyena shown here.

▼ **PANDA** *Not all carnivores are predators. The panda is a member of the carnivore family but it mainly eats plants.*

HOOFED MAMMALS

Zebra

Most hoofed mammals walk and run on the tips of their toes on hooves, which are simply large, heavy-duty toenails. This is a large and varied group, and all are herbivores. They are also known as "ungulates." They include deer, zebras, giraffes, and camels.

► **GIRAFFE** *The world's tallest mammal can reach more than 17 ft (5 m) in height.*

▼ **RED DEER** *Many hoofed mammals have horns or antlers. Antlers can grow particularly large on some species of deer.*

CETACEANS

Although whales and dolphins spend their lives in water, they have to come to the surface to breathe air; they have lungs, just like other mammals.

Humpback whale

▲ **BOTTLENOSE DOLPHIN** *Dolphins are a type of toothed whale. They live in groups.*

▼ **SOUTHERN RIGHT WHALE** *Some whales, like this one, are filter feeders, sieving plankton from the water through special plates in the mouth.*
